Outline day 1*

Tran Thai Hung

Last version: January 27, 2025

Table of contents

1.	Set up
	1.1 Git vs Github
	1.2 Rproject / Project Environment
2.	R Foundations
	2.1 Rscript
	2.2 Variable/Classes/Special Values
	2.3 Functions
	2.4 Scope
	2.5 Packages
3.	In-class Exercise
4.	Data Manipulation in R
	4.1 Data Import/Export
	4.2 Clean Column Names
	4.3 Simple Data Extraction
	4 4 Data Summary

List of Figures

^{*}Please do not circulate.

1. Set up

1.1 Git vs Github

- Difference between Git and GitHub.
- Why version control is important for collaboration.
- Hands-on: Creating and cloning repositories.

1.2 Rproject / Project Environment

- Overview of RStudio projects.
- Benefits of using a project environment.
- Setting up your first R project.

2. R Foundations

2.1 Rscript

- What is an R script?
- How to create and run scripts in RStudio.

2.2 Variable/Classes/Special Values

- Variables and data types (numeric, character, logical, etc.).
- Special values (e.g., NA, NaN, Inf, NULL).

2.3 Functions

- Creating and using functions.
- Built-in vs custom functions.

2.4 Scope

- Local vs global scope.
- The environment in R.

2.5 Packages

- Installing and loading packages.
- $\bullet\,$ Exploring CRAN, Bioconductor, and GitHub.

3. In-class Exercise

- Practice using what we've learned so far.
- Tasks involving creating variables, using functions, and exploring packages.

4. Data Manipulation in R

4.1 Data Import/Export

- Reading data from CSV, Excel, and other formats.
- Writing data to files.

4.2 Clean Column Names

• Standardizing column names using janitor::clean_names().

4.3 Simple Data Extraction

• Selecting rows and columns.

4.4 Data Summary

• Summarizing data with summary and skim.
